What is squalane?

Pronounced 'skwey-leen', squalane is a hydrogenated version of squalene, which is a compound that's naturally produced by our sebaceous glands.

Squalane is reportedly more shelf-stable than squalene, making it easier to use in skincare products.

Our sebaceous glands are responsible for producing sebum (oil), which is essentially a combination of wax esters, triglycerides and squalene.

These three things collectively form a protective coating on the outer layer of our skin.

Not only does it help moisturise our skin, but it acts as natural barrier.

Interestingly, squalene is naturally found in our blood too, as well as in olives, rice bran and wheatgerm.

It essentially works its magic by mimicking the sebum that's already present in our skin.
